

Which GIFTs follow genome size

a: correlation between genome size and the number of supported GIFTs in each class with at least 5 GIFTs (count in brackets), with 95% bootstrap intervals. b: one logistic regression per GIFT with at least 10 genomes carrying and lacking it; coloured at a false discovery rate of 0.05.

Classes come from gift_type, mode and curated database facets, and a GIFT can belong to several. Genomes are treated as independent although related genomes are not. An association describes encoded capability over this panel, not activity or phenotype.
