

Encoded repertoire by origin of the genome

Nonexclusive origin tags of 696 GTDB genomes (count in brackets), fitted jointly in phylogenetic regressions on the pruned bac120 tree. a: points with 95% intervals. b: a dot marks a false discovery rate below 0.05 over all 288 pairs.

Origin tags are coarse labels parsed from the free-text isolation source, and the panel was balanced on them by design. A difference describes encoded, curated capability, not activity, phenotype or ecological function.
