

Individual GIFTs by origin of the genome

The 45 GIFTs with the largest prevalence difference among the 117 that differ between an origin group and the rest of the panel. A dot marks Fisher's exact test at a false discovery rate below 0.05 over all 1,680 pairs.

This screen adjusts for neither genome size nor phylogeny, so a difference may reflect which lineages were sampled from an origin. It describes encoded, curated capability, not activity or ecological function.
