

Encoded GIFT repertoires across a broad bacterial phylogeny

696 balanced origin-classified complete-genome GTDB R11-RS232 species representatives x 163 current GIFTs, spanning every eligible order; gene-resolved Drakkar evidence evaluated against gifter database 2026.37.1

Rows follow the pruned GTDB bac120 tree; columns include every current GIFT. Genome size is the mean and standard deviation over all GTDB genomes of the species each row represents; a species with one genome has no deviation. Unsupported is not evidence of biological absence. The panel describes encoded capability, not activity or phenotype.
